Caesars Secret

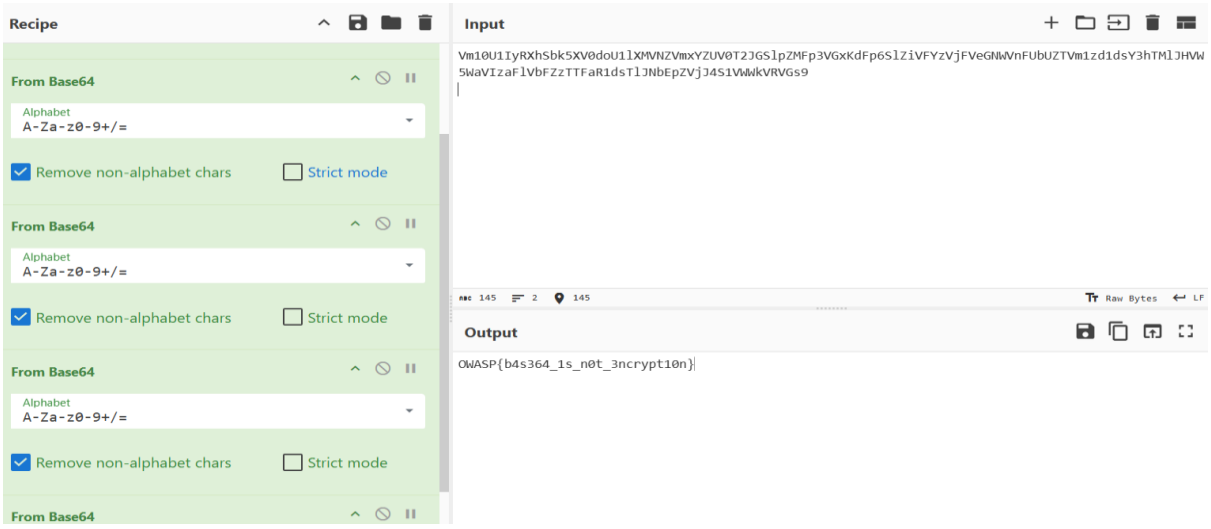

This was the first challenge in crypto and was really a easy one the discprtion mention the shift was between 1-25 so took the content to cyber chef and used the ROT13 recipe and rotated the lower case and upper case and got the flag

Flag: OWASP{c43s4r_c1ph3r_1s_34sy_t0_cr4ck}

Encoding chaos

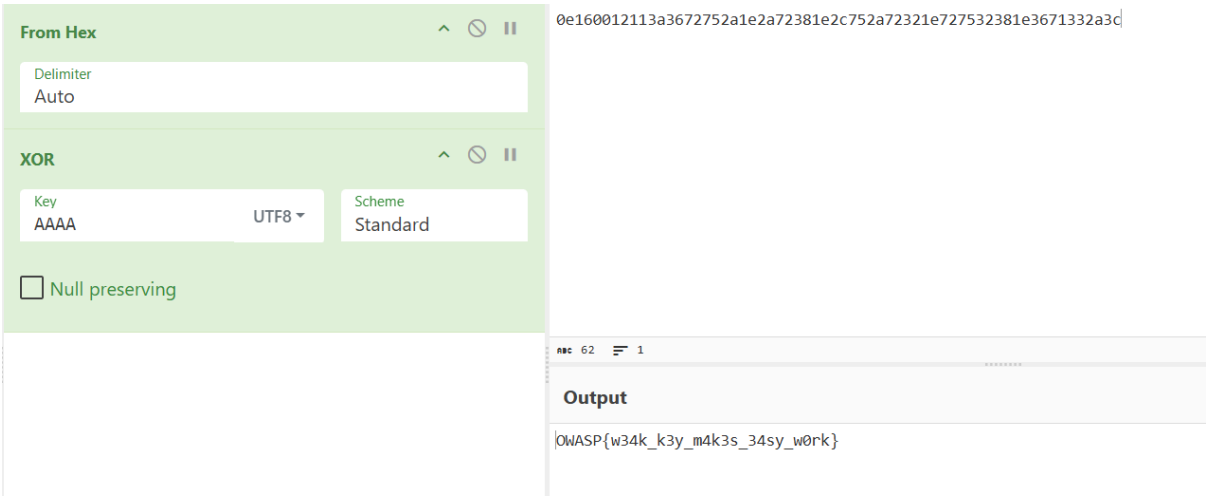

This task was really a chaos it looked base64 but how may times was it encrypted in base64 , the flag was encrypted 5 times in base64 which was decrypted 5 timed from base64 in cyberchef

FLAG: OWASP{b4s364_1s_n0t_3ncrypt10n}

Weak Lock

The challenge that had my head , it was said that a weak key is used to decrypt the flag and the size was 4 char tried almost every key I got in my (the weak ones) then after n number of attemps randomly I used “AAAA” which was the real key .

FLAG: OWASP{w34k_k3y_m4k3s_34sy_w0rk}

RSA Warmup

This is a simple RSA decryption challenge. The p and 1 values can be easily found by using the rsa decryption formula. n and e are already given in the doc. Using that and the formula
3233=p*q = 53*61
eph(n) = (p-1)(q-1)=52*60=3120
d = 1 mod 3120 / 17

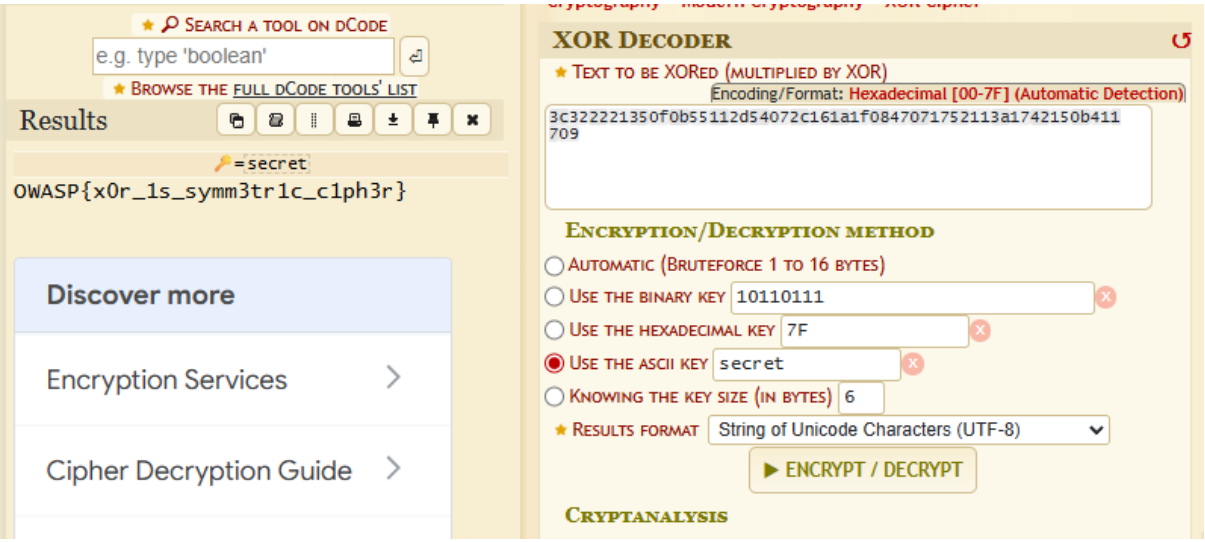

Substituting these values in a RSA decoder for each and every integer will reveal the flag.

FLAG : OWASP{rs4_s1mple_d3crypt10n}

XOR Riddle

The challenge file identified that the cipher text was XOR-encrypted. It also stated that the key was 6 bytes(6 letters) and that it was a common English word. I used an online decoder to solve this challenge. The first name that came to my mind was ‘common’, so I tried it and got nothing. The second word I tried was ‘secret’ and I immediately got the flag.

Flag: OWASP{x0r_1s_symm3tr1c_c1ph3r}
