Pixel Secret

This is a simple LSB Steganography challenge that I've come across in other CTFs. There's a lot of existing online tools out there to extract the hidden message. The basic ideas is to read the least significant bit in every color but it takes time and hence these online tools. The tool I used was https://matrixpuzzle.com/tools/lsb-decoder

FLAG : OWASP{50_l1ttl3_b1ts_h1d3_b1g_s3cr3t5}

Hidden in Plain Text

This is also another very simple challenge. As the name suggests, the flag was hidden in plain sight when opened in notepad.

FLAG : OWASP{h3x_d4mp5_4r3_y0ur_fr13nd}

Digital Footprint

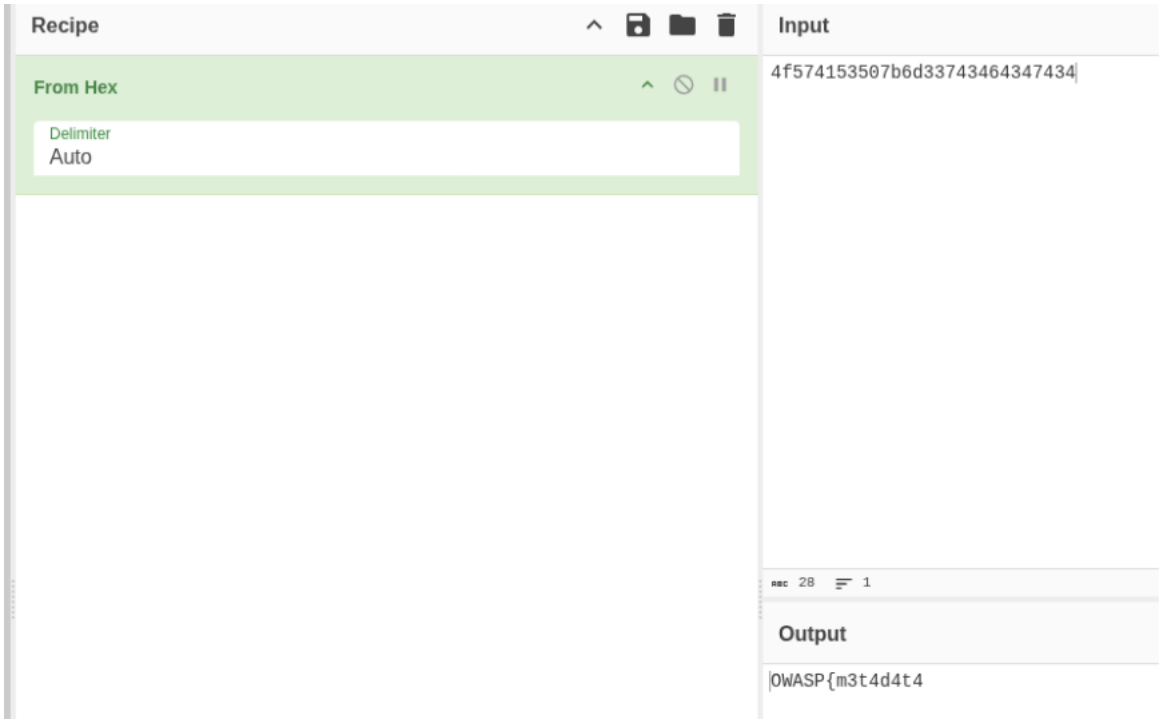

This is just another challenge that can be solved using basic linux tools. I first found out the file type and there I found that it had something hidden in the metadata.

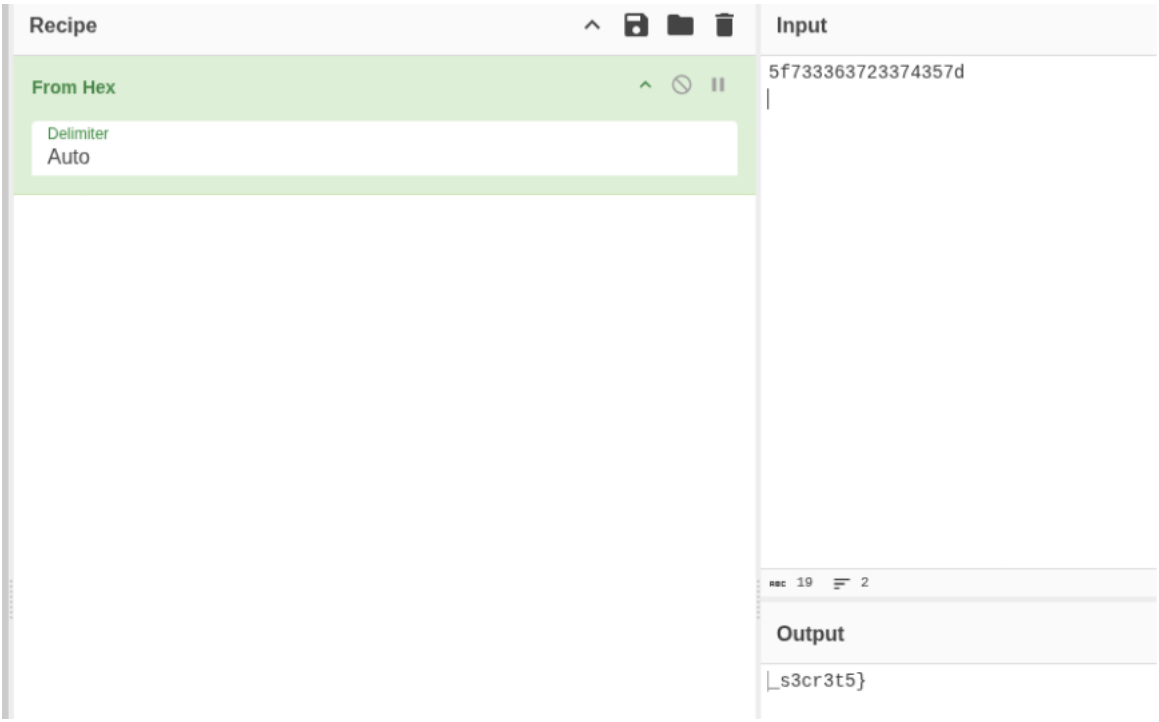

When I ran exiftool on this image I found the flag was scattered into three parts.

The second part is already decoded so the only thing left to do is to decode the 1st and 3rd parts using an online decoder and combine all three parts together.

FLAG : OWASP{m3t4d4t4_t3ll3s_4ll_s3cr3t5}
